

Week 5 Project

Name: D. Monica Infanta

Roll No: E25DA028

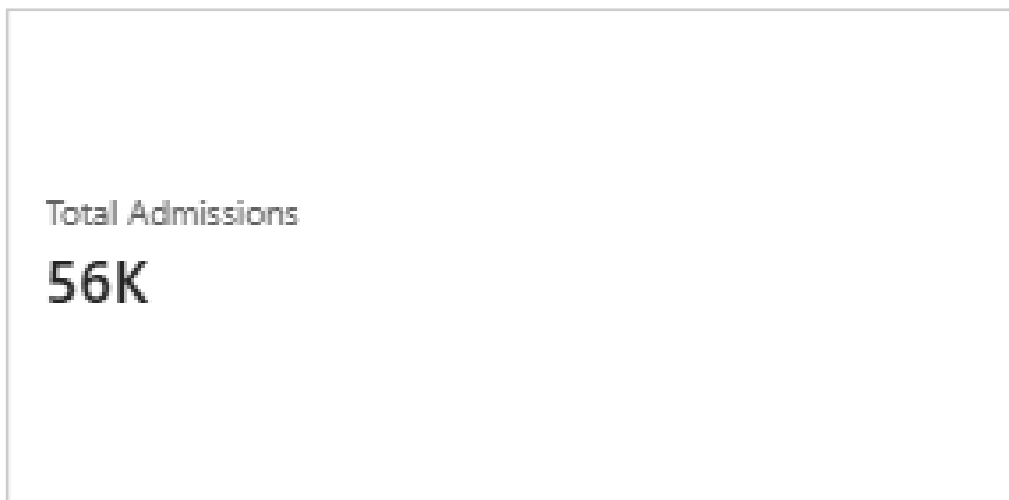

1. Total Billing

Explanation:

The total billing amount of the hospital is 1.28bn. It is the sum of all the billing amounts in the data, so this is the total money billed for all admissions. This is the main KPI and it shows the overall size of the hospital's business. It also helps to compare with the number of admissions and patients.

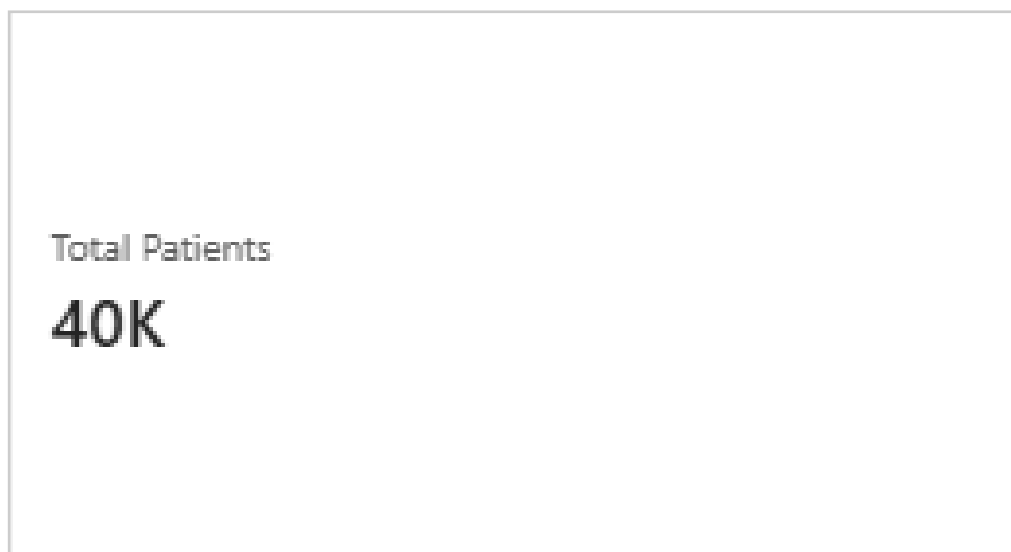

2. Total Admissions

Explanation:

The hospital has 56K admissions in total. This card counts every admission record in the data, using the Admission Key. It shows how busy the hospital is and how many times patients were admitted during the whole period.

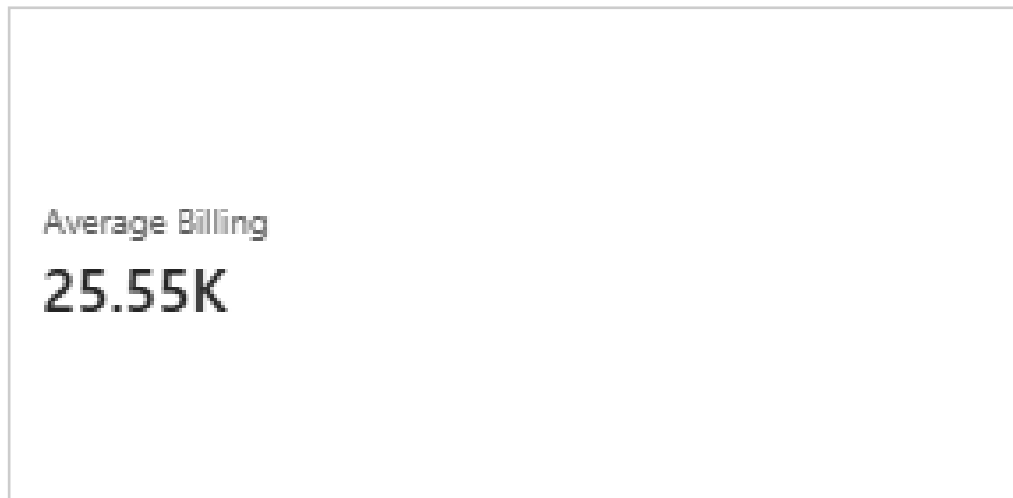

3. Total Patients

Explanation:

There are 40K different patients in the data. Admissions (56K) are more than patients (40K), so some patients were admitted more than once. On average, each patient has about 1.4 admissions, which shows that many patients came back to the hospital.

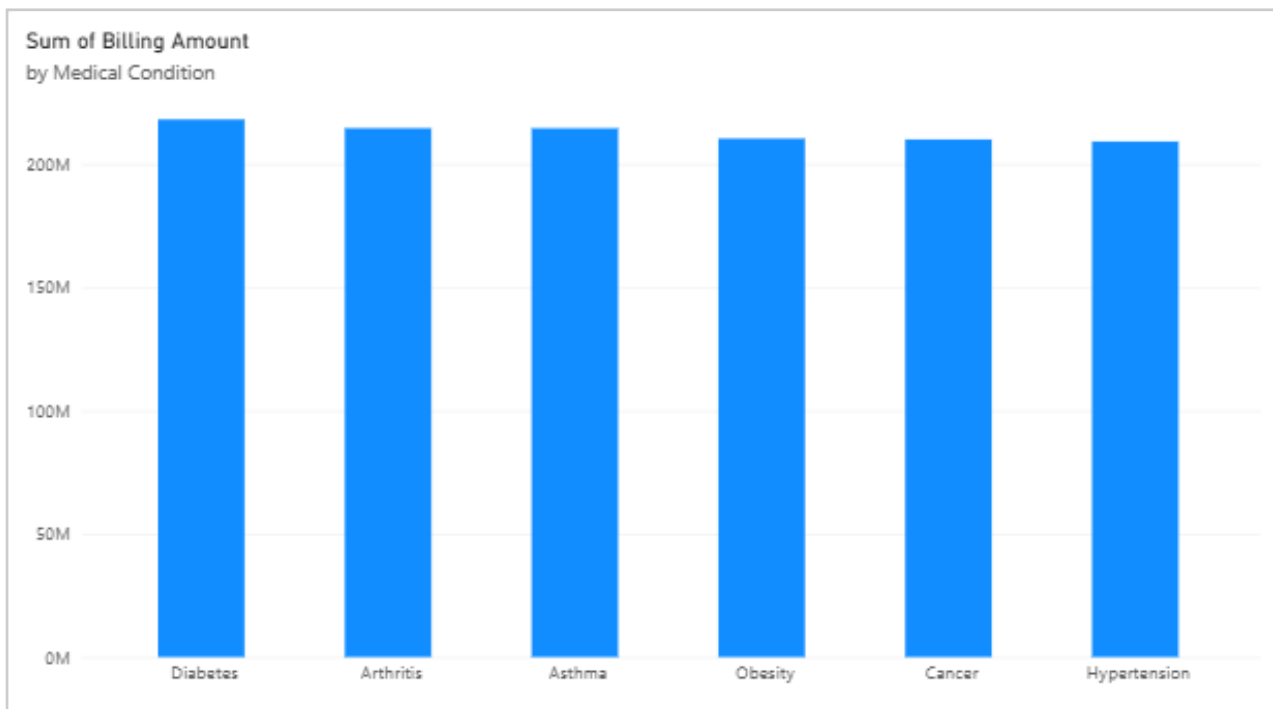

4. Average Billing

Explanation:

The average billing is 25.55K. This is the average bill for one admission, which is 1.28bn divided by 56K admissions. It shows how much the hospital earns from a single admission and is useful for checking the cost of treatment.

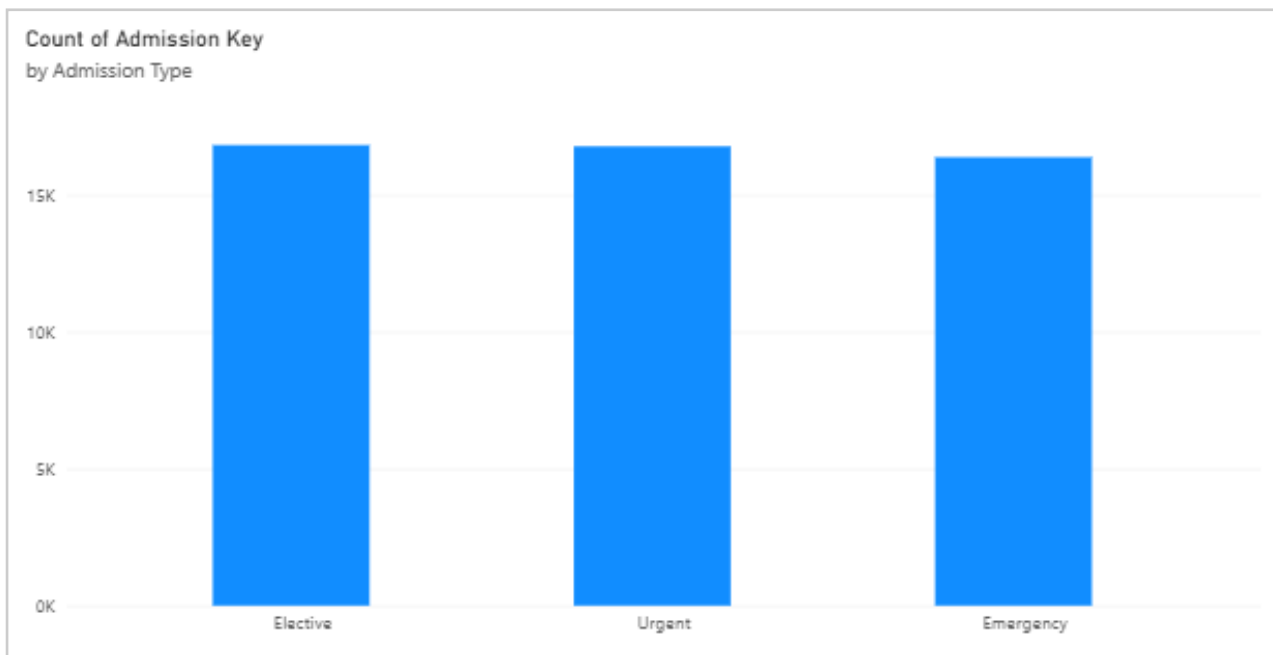

5. Billing Amount by Medical Condition

Explanation:

This bar chart shows the total billing for each medical condition. Diabetes is the highest with about 218M. Arthritis, Asthma, Obesity, Cancer and Hypertension are all close to 210M. So the difference between the conditions is very small and no single condition takes most of the billing. The billing is spread almost equally across all six conditions.

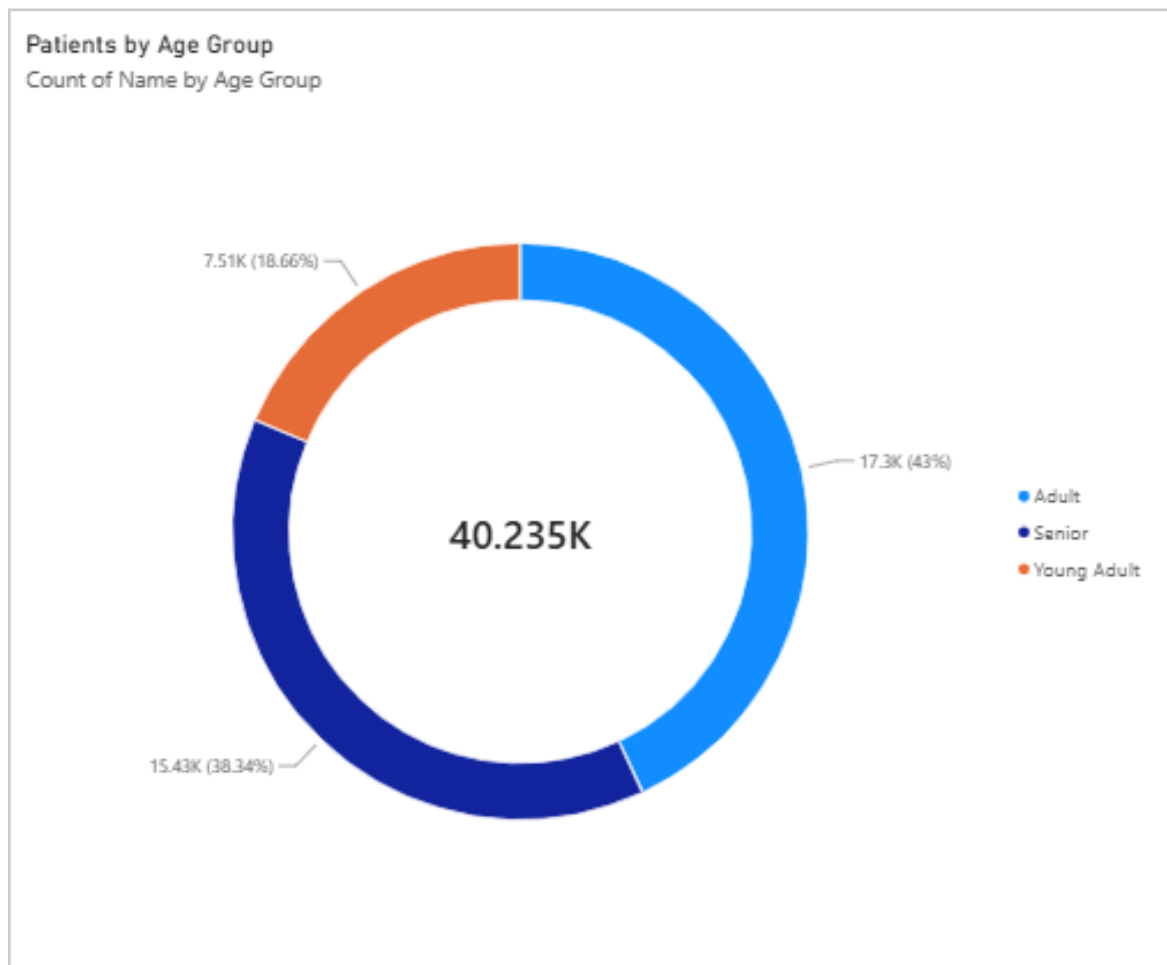

6. Admissions by Admission Type

Explanation:

This chart shows the count of admissions for Elective, Urgent and Emergency. All three types are almost the same, around 16K to 17K each. Elective and Urgent are slightly higher and Emergency is slightly the lowest. This means the hospital handles planned and unplanned cases in nearly equal numbers.

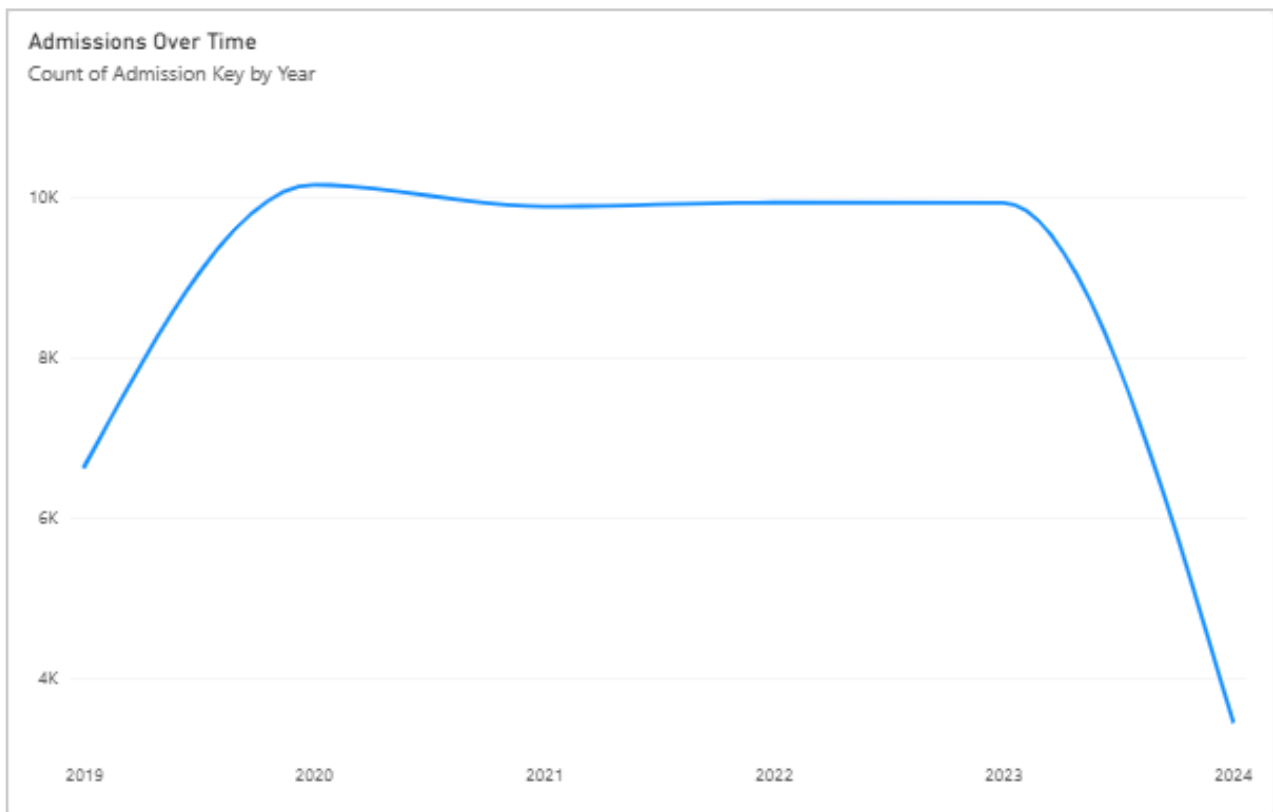

7. Patients by Age Group

Explanation:

This donut chart shows 40.235K patients divided into three age groups. Adult is the biggest group with 17.3K (43%), then Senior with 15.43K (38.34%), and Young Adult is the smallest with 7.51K (18.66%). Adults and seniors together are more than 80% of all the patients, so the hospital mostly serves older age groups.

8. Admissions Over Time

Explanation:

This line chart shows the number of admissions in each year. It started at about 6.5K in 2019, went up to around 10K in 2020 and stayed almost the same until 2023. In 2024 it falls sharply to about 3.5K. This drop may be because the 2024 data is not complete, so it should not be taken as a real decrease.

Conclusion

The dashboard gives a clear summary of the hospital data. The hospital has 40K patients and 56K admissions, with a total billing of 1.28bn and an average billing of 25.55K per admission.

Billing is spread almost equally across the medical conditions, with Diabetes slightly the highest. Admissions are also almost equal across Elective, Urgent and Emergency types.

Most of the patients are Adults (43%) and Seniors (38.34%), so the hospital mainly serves these age groups. Admissions were steady from 2020 to 2023, and the drop in 2024 is probably due to incomplete data.

Overall, the hospital's workload and billing are balanced and stable, and the dashboard helps to understand patients, admissions and billing easily.
